
Implementing an Azure Data Solution

Duration: 3 Days **Course Code: M-DP200**

Overview:

In this course, the students will implement various data platform technologies into solutions that are in line with business and technical requirements including on-premises, cloud, and hybrid data scenarios incorporating both relational and No-SQL data. They will also learn how to process data using a range of technologies and languages for both streaming and batch data.

The students will also explore how to implement data security including authentication, authorization, data policies and standards. They will also define and implement data solution monitoring for both the data storage and data processing activities. Finally, they will manage and troubleshoot Azure data solutions which includes the optimization and disaster recovery of big data, batch processing and streaming data solutions.

Target Audience:

The primary audience for this course is data professionals, data architects, and business intelligence professionals who want to learn about the data platform technologies that exist on Microsoft Azure.

The secondary audience for this course is individuals who develop applications that deliver content from the data platform technologies that exist on Microsoft Azure.

Objectives:

- After completing the course delegates will be able to:
- Explain the evolving world of data
- Survey the services in the Azure Data Platform
- Identify the tasks that are performed by a Data Engineer
- Describe the use cases for the cloud in a Case Study
- Choose a data storage approach in Azure
- Create an Azure Storage Account
- Explain Azure Data Lake Storage
- Upload data into Azure Data Lake
- Explain Azure Databricks
- Describe the Team Data Science Process
- Provision Azure Databricks and workspaces
- Perform data preparation tasks
- Create an Azure Cosmos DB database built to scale
- Insert and query data in your Azure Cosmos DB database
- Build a .NET Core app for Azure Cosmos DB in Visual Studio Code
- Distribute your data globally with Azure Cosmos DB
- Explain SQL Database and SQL Data Warehouse
- How to process data with Event Hubs and Stream Analytics
- How to process data with Azure Blob and Stream Analytics
- Explain how Azure Data Factory works
- Create Linked Services and Datasets
- Create Pipelines and Activities
- Azure Data Factory pipeline execution and triggers
- Configure Authentication
- Use storage account keys
- Use shared access signatures
- Configure Authorization
- Control network access
- Understand transport-level encryption with HTTPS
- Understand Advanced Threat Detection
- Explain the monitoring capabilities that are available
- Explain the Data Engineering troubleshooting approach
- Troubleshoot common data storage issues
- Troubleshoot common data processing issues
- Integrate data platforms

- Provision an Azure SQL database to store application data
 - Provision and load data in Azure SQL Data Warehouse
 - Import data into Azure SQL Data Warehouse using PolyBase
 - Explain data streams and event processing
 - Querying streaming data using Stream Analytics
 - Optimize relational data stores
 - Optimize NoSQL data stores
 - Optimize Streaming data stores
 - Manage disaster recovery
-

Prerequisites:

In addition to their professional experience, students who take this training should have technical knowledge equivalent to the following courses: M-AZ-900T01 Microsoft Azure Fundamentals

Content:

Module 1: Azure for the Data Engineer.

This module explores how the world of data has evolved and how cloud data platform technologies are providing new opportunities for business to explore their data in different ways. The student will gain an overview of the various data platform technologies that are available, and how a Data Engineers role and responsibilities has evolved to work in this new world to an organization benefit.

Lessons

Explain the evolving world of data

Survey the services in the Azure Data Platform

Identify the tasks that are performed by a Data Engineer

Describe the use cases for the cloud in a Case Study

Lab : Azure for the Data Engineer

Identify the evolving world of data

Determine the Azure Data Platform Services

Identify tasks to be performed by a Data Engineer

Finalize the data engineering deliverables

Module 2: Working with Data Storage.

This module teaches the variety of ways to store data in Azure. The Student will learn the basics of storage management in Azure, how to create a Storage Account, and how to choose the right model for the data you want to store in the cloud. They will also understand how data lake storage can be created to support a wide variety of big data analytics solutions with minimal effort.

Lessons

Insert and query data in your Azure Cosmos DB database

Provision a .NET Core app for Cosmos DB in Visual Studio Code

Distribute your data globally with Azure Cosmos DB

Lab : Building Globally Distributed Databases with Cosmos DB

Create an Azure Cosmos DB

Insert and query data in Azure Cosmos DB

Build a .Net Core App for Azure Cosmos DB using VS Code

Distribute data globally with Azure Cosmos DB

Module 5: Working with Relational Data Stores in the Cloud.

In this module, students will explore the Azure relational data platform options including SQL Database and SQL Data Warehouse. The student will be able explain why they would choose one service over another, and how to provision, connect and manage each of the services.

Lessons

SQL Database and SQL Data Warehouse

Provision an Azure SQL database to store data

Provision and load data into Azure SQL Data Warehouse

Lab : Working with Relational Data Stores in the Cloud

Explain SQL Database and SQL Data Warehouse

Create Pipelines and Activities

Azure Data Factory Pipeline Execution and Triggers

Module 8: Securing Azure Data Platforms.

In this module, students will learn how Azure Storage provides a multi-layered security model to protect your data. The students will explore how security can range from setting up secure networks and access keys, to defining permission through to monitoring with Advanced Threat Detection.

Lessons

Configuring Network Security

Configuring Authentication

Configuring Authorization

Auditing Security

Lab : Securing Azure Data Platforms

Configure network security

Configure Authentication

Configure Authorization

Explore SQL Server Books Online

Module 9: Monitoring and Troubleshooting Data Storage and Processing.

In this module, the student will look at the wide range of monitoring capabilities that are available to provide operational support should there be issue with a data platform architecture. They will explore the data engineering troubleshooting approach and be able to apply this to common data storage and data processing issues.

Lessons

Choose a data storage approach in Azure	Create an Azure SQL Database to store data	Data Engineering troubleshooting approach
Create an Azure Storage Account	Provision and load data into Azure SQL Data Warehouse	Azure Monitoring Capabilities
Explain Azure Data Lake storage	Module 6: Performing Real-Time Analytics with Stream Analytics.	Troubleshoot common data issues
Upload data into Azure Data Lake		Troubleshoot common data processing issues
Lab : Working with Data Storage	In this module, students will learn the concepts of event processing and streaming data and how this applies to Events Hubs and Azure Stream Analytics. The students will then set up a stream analytics job to stream data and learn how to query the incoming data to perform analysis of the data. Finally, you will learn how to manage and monitor running jobs.	Lab : Monitoring and Troubleshooting Data Storage and Processing
Choose a data storage approach in Azure		Explain the Data Engineering troubleshooting approach
Create a Storage Account		Explain the monitoring capabilities that are available
Explain Data Lake Storage	Lessons	Troubleshoot common data storage issues
Upload data into Data Lake Store	Explain data streams and event processing	Troubleshoot common data processing issues
Module 3: Enabling Team Based Data Science with Azure Databricks.	Querying streaming data using Stream Analytics	Module 10: Integrating and Optimizing Data Platforms.
This module introduces students to Azure Databricks and how a Data Engineer works with it to enable an organization to perform Team Data Science projects. They will learn the fundamentals of Azure Databricks and Apache Spark notebooks; how to provision the service and workspaces and learn how to perform data preparation task that can contribute to the data science project.	How to process data with Azure Blob and Stream Analytics	In this module, the student will explore the various ways in which data platforms can be integrated based upon different business requirements. They will also explore the various ways in which data platforms can be optimized from a storage and data processing perspective to improve data loads. Finally, disaster recovery options are revealed to ensure business continuity.
	How to process data with Event Hubs and Stream Analytics	
Lessons	Lab : Performing Real-Time Analytics with Stream Analytics	
Explain Azure Databricks and Machine Learning Platforms	Explain data streams and event processing	Lessons
Describe the Team Data Science Process	Querying streaming data using Stream Analytics	Integrating data platforms
Provision Azure Databricks and workspaces	Process data with Azure Blob and Stream Analytics	Optimizing data stores
Perform data preparation tasks	Process data with Event Hubs and Stream Analytics	Optimize streaming data
Lab : Enabling Team Based Data Science with Azure Databricks	Module 7: Orchestrating Data Movement with Azure Data Factory.	Manage disaster recovery
Explain Azure Databricks and Machine Learning Platforms	In this module, students will learn how Azure Data factory can be used to orchestrate the	Lab : Integrating and Optimizing Data Platforms

Describe the Team Data Science Process	data movement and transformation from a wide range of data platform technologies. They will be able to explain the capabilities of the technology and be able to set up an end to end data pipeline that ingests and transforms data.	Integrate Data Platforms
Provision Azure Databricks and Workspaces		Optimize Data Stores
Perform Data Preparation Tasks		Optimize Streaming Data
Module 4: Building Globally Distributed Databases with Cosmos DB.	Lessons	Manage Disaster recovery
In this module, students will learn how to work with NoSQL data using Azure Cosmos DB. They will learn how to provision the service, and how they can load and interrogate data in the service using Visual Studio Code extensions, and the Azure Cosmos DB .NET Core SDK. They will also learn how to configure the availability options so that users are able to access the data from anywhere in the world.	Explain how Azure Data Factory works	
	Create Linked Services and datasets	
	Create pipelines and activities	
	Azure Data Factory pipeline execution and triggers	
Lessons	Lab : Orchestrating Data Movement with Azure Data Factory	
Create an Azure Cosmos DB database built to scale	Explain how Data Factory Works	
	Create Linked Services and Datasets
