

Building Resilient Microservices with Istio and Red Hat OpenShift Service Mesh

Duration: 3 Days Course Code: DO328 Delivery Method: Virtual Learning

Overview:

Control, manage, trace, monitor, and test your microservices with Red Hat OpenShift Service Mesh.

Red Hat Openshift created an enterprise-ready, multi-tenant platform that made deploying and scaling microservice applications efficient and repeatable. But as these architectures become larger and more complex, defining how these services interact with each other becomes increasingly difficult.

Modern organizations are adopting complex application architectures that include microservices, virtual machines, and AI integration. While offering benefits like scalability, these introduce operational and developmental challenges.

With Red Hat OpenShift Service Mesh, organizations have a platform ready to manage critical aspects of service communication, including routing, observability, security, and resilience.

Red Hat OpenShift Service Mesh facilitates managing service interaction, providing service tracing, and creating a visual representation of communication pathways.

Building Resilient Microservice Applications with Red Hat OpenShift Service Mesh (DO328) teaches students service monitoring, management, and resilience with Red Hat OpenShift Service Mesh.

This course is based on Red Hat OpenShift Service Mesh 3.1, and Red Hat OpenShift 4.18.

Note : Starting January 1, 2026, Red Hat introduces RHLS-Course — a flexible subscription model now included with this catalog offering. This replaces the previous direct virtual class enrollment from Global Knowledge.

When you purchase this item, you'll receive an RHLS subscription at the course level, giving you the freedom to choose the schedule that works best and self-enroll in your selected class.

Your RHLS subscription includes:

- One live, instructor-led virtual session
- 12 months of self-paced learning access
- One certification exam with a free retake

Onsite Classroom-based sessions and closed course options remain unchanged.

Updated Jan2026

Virtual Learning

This interactive training can be taken from any location, your office or home and is delivered by a trainer. This training does not have any delegates in the class with the instructor, since all delegates are virtually connected. Virtual delegates do not travel to this course, Global Knowledge will send you all the information needed before the start of the course and you can test the logins.

Target Audience:

Developers and platform engineers who need to manage and secure reliable microservices communication in a Red Hat OpenShift-based environment.

Objectives:

■ After this course participants should be able to:	■ Manage Traffic with OpenShift Service Mesh
■ Introduce OpenShift Service Mesh	■ Secure OpenShift Service Mesh
■ Observe OpenShift Service Mesh	■ Consolidate and validate the understanding of Red Hat OpenShift Service Mesh

Prerequisites:

- Red Hat OpenShift Developer II: Building and Deploying Cloud-native Applications (DO288), or demonstrate equivalent experience with Red Hat OpenShift.
- Red Hat Cloud-native Microservices Development with Quarkus (DO378), or demonstrate equivalent experience in creating microservice applications, is recommended, but not required.

Testing and Certification

- Red Hat Certified Specialist in Building Resilient Microservices exam (EX328)

Take Red Hat free assessment to gauge whether this offering is the best fit for your skills [Red Hat Skills Assessment](#)

Follow-on-Courses:

None

Content:

Introducing OpenShift Service Mesh

- Describe the basic concepts of microservice architecture and how Red Hat OpenShift Service Mesh provides observability, security, and traffic management for distributed applications.

Observing the OpenShift Service Mesh

- Trace and visualize a Red Hat OpenShift Service Mesh with Red Hat OpenShift observability.

Managing Traffic with OpenShift Service Mesh

- Manage, control, and test application traffic in Red Hat OpenShift Service Mesh by applying routing strategies, resiliency policies, and fault injection techniques to build safer and more reliable distributed systems.

Securing the OpenShift Service Mesh

- Design, implement, and validate a comprehensive zero-trust security posture in Red Hat OpenShift Service Mesh, ensuring all traffic is secured, authenticated, and authorized.

Comprehensive Review

- Consolidate and validate the understanding of Red Hat OpenShift Service Mesh.
