Power Systems for AIX - Virtualization I: Implementing Virtualization

Duration: 5 Days   Course Code: AN30G   Delivery Method: Virtual Learning

Overview:

This course provides an overview of the PowerVM edition's features on POWER6 and POWER7 processor-based systems. It explains the new features and benefits of virtualization including processor virtualization, Integrated Virtual Ethernet, Virtual I/O Server, and virtual devices, such as virtual Ethernet, virtual SCSI, and virtual Fibre Channel adapters. Basic and advanced configurations of the Virtual I/O Server and its clients are discussed including various availability options.
Students are also given additional details about PowerVM features that were introduced in Power Systems for AIX I: LPAR Configuration and Planning (AN11G).

Virtual Learning

This interactive training can be taken from any location, your office or home and is delivered by a trainer. This training does not have any delegates in the class with the instructor, since all delegates are virtually connected. Virtual delegates do not travel to this course, Global Knowledge will send you all the information needed before the start of the course and you can test the logins.

Target Audience:

This intermediate course is intended for system administrators, technical support personnel, and business partners responsible for implementing LPARs on IBM Power Systems servers.

Objectives:

■ After completing this course, you should be able to:

■ ·   Discuss the advantages or value of PowerVM edition's features

■ ·   Define micro-partitioning and shared processor LPARs

■ ·   Discuss the benefits of simultaneous multithreading

■ ·   Discuss and configure the Integrated Virtual Ethernet (IVE)

■ ·   Install and configure the Virtual I/O Server

■ ·   Configure virtual network devices, such as virtual Ethernet and shared Ethernet adapters

■ ·   Configure virtual SCSI and virtual Fibre Channel storage adapters

■ ·   Configure virtual SCSI target devices on a virtual SCSI adapter

■ ·   Define file-backed storage pools and file-backed virtual optical devices

■ ·   Identify single points of failure in virtualized environments

■ ·   Configure multiple VIO servers for high availability

■ ·   Configure advanced virtual networking options

■ ·   Configure the shared Ethernet adapter failover feature

■ ·   Configure advanced virtual SCSI options

■ ·   Configure MPIO in a VIO server's client partition

■ ·   Manage the service events, configure call home, add, exchange FRUs, and discuss FSP failover

Prerequisites:

• AIX Jumpstart for UNIX Professionals (AN14G)• Power Systems for AIX III: Advanced Administration and Problem Determination (AN15G)• Power Systems for AIX II: Implementation and Administration (AN12G)Students must have advanced system administration experience with AIX 6 or AIX 7. This prerequisite can be met by attending one of the following courses:

Alternatively, students must have equivalent AIX and LPAR skills.

General TCP/IP knowledge is strongly recommended. This prerequisite can be met by attending TCP/IP for AIX Administrators (AN21G).

Students are also expected to have logical partition administration skills on POWER6 or POWER7 processor-based systems, which can be obtained by attending Power Systems for AIX I: LPAR Configuration and Planning (AN11).

Content:

Introduction to partitioning	Virtual I/O Server and virtual devices	Migration from physical to virtual storage
Processor virtualization	Virtual network configuration with dual VIOS	HMC Service Management
Integrated Virtual Ethernet	Virtual SCSI configurations with dual VIOS	PowerVM advanced systems maintenance
Virtual Ethernet	N_Port ID virtualization
