
Beginning Server-Side Application Development with Angular

Duration: 2 Days Course Code: LO035410 Delivery Method: Virtual Learning

Overview:

Web applications built with Angular can be optimized for search engines (SEO). Building support for SEO in apps means that search engines can read and understand the pages, and that the pages have dynamic data that is specifically aimed at search engines (meta tags). This increases the visibility of your app giving higher search rankings and more links, resulting in more revenues for you or your client. Angular provides built-in features that can be leveraged to ensure apps enjoy maximum visibility on the web. Angular also provides features to ensure that our apps keep working without an internet connection or on a slow connection as well.

Virtual Learning

This interactive training can be taken from any location, your office or home and is delivered by a trainer. This training does not have any delegates in the class with the instructor, since all delegates are virtually connected. Virtual delegates do not travel to this course, Global Knowledge will send you all the information needed before the start of the course and you can test the logins.

Target Audience:

This course focuses on creating a progressive web app using Angular that is optimized for search engines. As such, we do not cover the basics of Angular. Also, this course uses Angular CLI to create the app. This course is targeted at Angular developers interested in using Angular's features to bring SEO into their app development process.

Objectives:

- In this course, we will learn how to use Angular to create a progressive web app (PWA) that has great support for SEO. We will begin by identifying what makes an app SEO friendly and installing Angular CLI. We will then build out the UI and application components. By the end of the first lesson, we will have an app ready that is built using Angular's best practices. In the next lesson, we will implement server-side rendering. We will create a server with Express.js and add dynamic metadata to our app. In the final lesson, we will enable and configure service workers for our app, which will enable our app to work offline.
 - With this course, you'll be equipped to create modern, SEO-friendly web apps with best practices using Angular CLI. This course focuses on creating a progressive web app using Angular that is optimized for search engines. As such, we will not focus on understanding Angular basics.
-

Prerequisites:

Previous app development experience using Angular is required.

The students taking this course must be well-versed with the following concepts:

- The basics of Angular
 - HTML
 - CSS
 - Basics of TypeScript
-

Content:

Lesson 1: Creating the Base Application

- Installing Angular CLI
- Generating a New Application
- Setting Defaults for Angular CLI
- Configuring Global Styles
- Creating UI Modules and Components
- Creating the Application Module and Components

Lesson 2: Server-Side Rendering

- Generating the Server App
- Adding Dependencies for the Server App
- Adding Run Scripts to package.json
- Implementing a Web Server
- Adding Dynamic Metadata

Lesson 3: Service Workers

- Installing Dependencies
- Enabling the Service Worker
- Configuring the Service Worker
- Testing the Service Worker
- Debugging the Service Worker
